Job Alert Emails: Implementation Plan

Connect Maratha · Implementation plan · 9 October 2026

1. Idea

Members who opt in receive a daily or weekly email listing new jobs from the Connect Maratha jobs section that match their preferences. The email works like a placement-class job alert: a header, a greeting, one card per job, and an Apply button that opens the job in the app or website.

The plan has five parts: preferences, matching, a scheduler, an email service, and the email design.

2. Collect preferences

Add a **Job alerts** screen in the app and website. The member chooses:

- Roles or skills they want
- District or city
- Job type (full-time, internship)
- How often to get emails (daily or weekly)

Alerts stay off until the member turns them on. The choices are saved in the member's record in the database.

3. Match jobs to members

Every time the system runs, it:

- Takes the new jobs posted since the last email
- Compares each job's title, field, and district with each member's preferences
- Picks the best 5 to 8 matches for each member

Start with simple keyword and district matching. Smarter ranking can be added later.

4. Scheduler

A scheduled task in the Node.js backend runs once a day, for example at 8 AM. Options:

- **node-cron** for a simple setup
- **BullMQ with Redis** when there are many members

5. Email service

Do not send email from your own server. Use a provider:

- Amazon SES, Brevo, SendGrid, or Resend
- Nodemailer is the library the Node.js code uses to talk to the provider

Check each provider's free limits. Set up **SPF, DKIM, and DMARC** on the domain so emails reach the inbox and not spam.

6. Email design

Build one HTML email template with:

- A header and a greeting
- One card per job: title, company, source, location, experience, salary, posted time
- An "Apply" button that opens the job in the app
- "Manage alerts" and "Unsubscribe" links at the bottom

A tool like MJML, or a simple HTML email template, makes this easier.

7. Order to build

1. The preferences screen and where to save the choices
2. The matching logic, tested with real jobs
3. The email template, tested in Gmail and on a phone
4. The email provider and domain setup
5. The scheduler, first in test mode (log only), then live
6. Tracking opens, clicks, and unsubscribes in the provider's dashboard

8. Important points

- Send only to members who opted in, and make unsubscribing one click.
- Never share member emails with anyone else.

- Add a push notification (Firebase) as a second channel later.
- If several servers run (PM2 cluster), run the scheduler on only one, or members will get duplicate emails.
